EVERYTHING SHE IS, ON ONE PAGE

on your PC · new in 0.7.9 · cloud service · safety rule

A desktop companion for Windows (C# 5, .NET Framework 4.8). Her memory, ears, voice and settings live on your PC. Only the boxes marked CLOUD send anything out, and each one is a service you connect yourself.

WAYS IN >

Your mic
local Parakeet ears: voice chat, Hey Capri, hotwords for her name, barge-in

Typing
the pencil box above her

Your phone
her room as a home-screen web app over Tailscale: chat, hold to talk, PC view, job keys, Shortcuts

Discord CLOUD
your DMs to her bot, friends' DMs, who's online

Discord calls
call mode: friends in your voice call talk with her

Her eyes
screenshots of the monitor you mean; League live data and client

HER MIND >

Quick routes (code, no model)
settings, "what's my cs", "is X online", music, volume, stop, undo: answered straight away

Understanding + the moment
an unclear ask is read with the talk and what's on your PC (Sonnet 5.5 if Smarter brain is on); every path sees one picture of the moment

Her brain: Claude Haiku 5.5 CLOUD
The same brain for typing, voice, Discord and the phone. It answers, or picks one of her tools.

Honesty checks
say equals do: a claim she can't back with a real action is caught

Side calls CLOUD
memory pass, judges, summaries (Haiku, Sonnet when it struggles)

In-game lockout
no clicks, keys or typing while a game runs; never optional

Buy gate + spend cap
a purchase waits for your yes; monthly API cap

WHAT SHE DOES >

Voice
her cloned local voice (Chatterbox), ElevenLabs CLOUD or the free voice as fallback

Hands
apps, windows, media, volume; desktop jobs with her pink pointer; buttons by name so your cursor stays free

Her own browser
a hidden Chrome for web jobs, never your mouse

Her Claude Code sessions
runs your projects on your plan: questions answered from the project's notes, real decisions asked to you, landing only on your yes

Fun and extras
clones, throw her, hologram, her own clock, diagrams she draws, Discord status art, stream co-host

League
pro builds, counters, CS/MIN strip, objective calls, accept and pick while you're away

WHAT SHE KEEPS >

Her Obsidian vault (long-term memory)
me.md with an always-on Core, People notes, a journal page per day, every chat word for word, plans, lessons, what she did. Synced only to your phone.

Short-term
the last 32 messages, a rolling summary, the current goal, the moment picture

On the PC only
settings and keys (encrypted), activity log, meaning-search cache. None of it goes into the app you download.

ONE THING YOU SAY, START TO FINISH

Example: you say "tell Sam I'm running late, and remember his birthday is the 30th" while a game is open in the background.

1 Hear
Parakeet turns your voice into text on the PC. Her name is a hotword, and a misheard "Capree" still counts.

→

2 Quick route?
Obvious commands (volume, stop, a setting) run from code with no model. This one isn't, so it goes on.

→

3 Understand
Who is "Sam"? The name matcher finds People/Sam.md (sound-alikes and Lithuanian name forms too). Two Sams? She asks one short question.

→

4 The moment
One picture: time, where you are, the game, the window in front, her open job. Each path reads only the slice it needs.

→

5 Think
Haiku gets one fresh request: her persona, Core notes, what Recall found, lessons, the last 32 messages.

→

6 Pick a tool
The tool step chooses the discord tool with "running late" for Sam. Hands that click stay locked while the game runs.

→

7 Check
Say equals do: "sent it" is only said when the tool really sent. Guarded settings need your own clear words.

→

8 Answer
Her voice (or the bubble, or your phone, or Discord when you're away) and the action itself.

→

9 Remember
Next to the reply, the memory pass writes "Birthday: 30 October" into People/Sam.md, with the day you said it.

→

10 Keep
The chat goes to the day's archive; "messaged Sam" goes to her action log, so later she knows it's done.

HER MEMORY LAYERS >

LAYER	WHAT IT HOLDS	WHEN SHE READS IT
Core	who you are, close people, routine, current projects; small on purpose	every message
Recent talk	last 32 messages, rolling summary, the current goal	every message
Notes	People, places, facts, each with a date and a link to the day	when Recall finds them (word and meaning search)
Day pages	what you did each day, from your own words	"what did I do on Tuesday"
Chat archive	every conversation, by day	questions about the past
Plans + lessons	promises with dates; what she got wrong	check-ins raise plans; lessons before she acts
Action log	what she did, as short gists	so she never claims or repeats things

WHY HER CONTEXT NEVER PILES UP >

Fresh every time. The model keeps nothing between messages. Every request is rebuilt from the parts above, and each part has a cap, so day 300 is as big as day 1.

Search, not stuffing. Older talk isn't sent along. It's found again when it matters: word search plus a local meaning model (bge-base, on your PC).

Changes keep history. "I don't go to the gym anymore" replaces the fact and moves the old one under History with its date. The night review catches missed saves and contradictions.

WHAT SHE DOES WITHOUT BEING ASKED

Everything she starts herself goes through one gate, so you hear things once, at a good time, in the right place.

Ideas come in
heartbeat (calendar, mail, birthdays), offers, away check-ins, friends coming online, care nudges (water, food), morning brief, night wrap-up, follow-ups

→

Still true?
a line about a plan is dropped once the plan is done, dropped, stale or waiting

→

One gate
held if the same line came in 24 h, the same friend in 20 h or the same topic in 48 h; your own reminders always pass

→

Good time?
never in quiet hours or while you talk; in a League game only things about the game

→

Right place
voice at the PC, Discord when you're away, the away box when you're back, your phone if it's open

HER TIMERS >

Heartbeat
every so often: anything worth telling you

Evening tidy-up
files notes into the vault, writes the day page, tells you what she filed

Night review
missed saves, merged lessons, old plans archived, every change logged

Fresh start 05:00
daily restart and a memory cap

WHEN YOU'RE AWAY >

Home and away
"I'm leaving" or your phone leaving the Wi-Fi: she goes quiet; you're back, she wakes

Long jobs
hours of work in 20-minute parts, kept across restarts, reports on Discord

Auto-reply
answers friends you listed on Discord (chat back, status only, or ask first); never promises anything for you

AUTONOMY (OFF UNTIL YOU TURN IT ON) >

Suggest, ask first, or do and tell
per area: mail drafts, calendar, reminders, research

Never on her own
sending in your name, buying, deleting, spending, SECURITY or the lockout

Undo
"undo that" removes only what she made

HER PROJECTS, YOUR CALLS, YOUR PHONE

Three bigger things that arrived together. Each is a switch in Capri+, and the first two are off until you turn them on.

SHE RUNS YOUR CLAUDE CODE PROJECTS (PROJECTS TAB) >

Start
one visible Remote Control session at a time, in a folder you listed; read and plan unless the line ends | full; never during a game

→

Questions
routine ones answered from the project's own notes, with the source; real decisions and plans go to you wherever you are

→

Long work
past 250k tokens the session wraps up and a fresh one carries on from its checkpoint

→

Landing
a finished branch is told to you once; it lands only on your yes, and only counts once git shows it on main

Upstream watch
new commits in the original Capri get ported on branches

Her ideas
one a day, on its own branch; anything about money, keys or safety waits for you

| watch projects
read-only: Read, Grep and Glob only, one report a day

Proposals
on your ask she thinks a new project through; "start it" makes only a local folder and a plan

CALLS (VOICE TAB) >

Her voice in your mic
through a virtual cable, friends in Discord or a game hear her and you through one mic

Call mode
friends in your call talk with her; anything that would touch your PC waits for your own yes

Name needed in games
in a game she only answers lines with her name, so friends' chatter doesn't set her off

YOUR PHONE (HOME TAB) >

Her room on your iPhone
a home-screen web app, only over Tailscale: her pose follows the PC, chat, hold to talk, her voice on the phone

PC view and keys
see her jobs, stop or pause them, a screenshot only when you ask (never saved)

Shortcuts pack
alarms, timers, reminders, music and Focus through Apple Shortcuts, plus Share to Capri

THE RULES SHE NEVER BREAKS

These hold whatever the settings say, whoever asks, and in every version.

In-game lockout
while a game runs her hands never click, type or press keys. It can't be switched off, not even by voice or Blackwall mode.

Buying
a buy button, an order step or a payment always stops for your yes. She never types card numbers, IBANs or PINs.

Your words only
SECURITY, buying, caps, full access and the never-look list change by voice only when you clearly name them, never on a friend's or her own say-so.

YOUR DATA STAYS YOURS >

On your PC and phone
her vault, your settings and keys (encrypted), her logs. Nothing is uploaded except the requests to the services you connect.

Never in the app or on GitHub
friends' names, your accounts, your address and school are kept out of the code, tests and releases. A check refuses to publish a release that contains any of them.

Screenshots
never saved to disk; the never-look list hides apps and sites from her eyes

UPDATES >

From our own releases only
the updater reads only github.com/LittleTokyo1/capri-plus (installer, SHA256SUMS.txt, LICENSE.md) and checks the hash

Asks first, never during a game
she tells you a new version is ready; it installs on your yes

One build for everyone
the build you run is the build your friends get, minus anything personal; features are switches with the same defaults
